Editorial Committee

Joseph Branin, Ohio State University
Editor: College and Research Libraries

Connie Foster, Western Kentucky University
Editor: Serials Review

Peggy Johnson, University of Minnesota
Editor: LRTS: Library Resources and Technical Services

Gary Pitkin, University of Northern Colorado
Editor: Technical Services Quarterly

Bonnie Tijerina, University of California, Los Angeles
Editor: Journal of Electronic Resources Librarianship

Editorial Assistant
Karla Hahn, Association of Research Libraries

About the LIS Editors Group

The group seeks to provide a collegial and supportive space for editors to engage in frank discussions of their concerns. For this reason registration for the discussion list and attendance at any face-to-face meetings is generally restricted to editors. Although the group has focused on journal editing, editors of other kinds of LIS publications are also welcome to participate.

The LIS editors group advances its work by a discussion list, a web site (http://www.lis-editors.org), and periodic face-to-face meetings. In addition, the group is drafting a statement of ethics and best practices for LIS journal editors.

The group has been editor-organized and editor-led from its first meeting, but has received support from the Association of Research Libraries and the Association of College and Research Libraries. The associations have provided staff support, technical services, and refreshments.

To receive notices about meetings and participate in discussion with other LIS editors, please email Karla Hahn (karla AT arl.org) and introduce yourself, mentioning the journal you edit.

To comment on this draft

The best way to offer comments is through participation in the LIS Editors Group discussion list. Please see the instructions on joining above.

Acknowledgements

This document reflects the work of many individuals and the particular support of two organizations, the Association of Research Libraries and the Association of College and Research Libraries. An early draft of the document was improved by comments and discussion occurring at the meeting the LIS Editors Group held at the ALA Midwinter Meeting in January 2009. The editorial committee would especially like to thank participants in that meeting: Faye Chadwell, Julia Gelfand, Peter Hernon, Sarah Pritchard, Sandra Roe, Scott Seaman, and Diane Zabel.

Endorsers of the Statements and Best Practices

On Friday, July 10 in Chicago, IL the LIS Editors Group will meet to finalize the statements. Upon finalization, individual editors will be invited to publicly endorse the statements. A list of endorsers will be maintained on a separate web page on the group's web site – http://www.lis-editors.org.

Background

It is common for editors in a discipline to organize themselves and meet periodically to share information and consider best practices. Lacking a formal organization to promote the work of editors of library and information science (LIS) journals, in January of 2008 a small group of editors of LIS journals met to discuss common concerns and identify practices that can strengthen the collective ability of the journals to serve the discipline and the professionals who create and apply that literature. Convened by the editors of two journals, Joseph Branin, editor of College & Research Libraries, and Charles Lowry, editor of portal: Libraries and the Academy, the group gathered to discuss issues of shared concern and explore strategies for developing a set of shared ethical statements and best practices. The eight attending editors represented a wide range of high impact journals in the discipline, largely, although not exclusively, association journals.

The discussion highlighted a diversity of practice and a substantial unity of concerns with regard to many issues. After considering some of the kinds of activities pursued by other disciplinary editors’ groups and their own concerns, there was a strong consensus that LIS editors would benefit from an opportunity to meet and engage in frank and collegial discussions that would develop into best practice statements and simply to enrich their own roles as editors. Following a second meeting in Anaheim, California, in June 2008, several actions were initiated to advance the development of a set of statements regarding editorial ethics and best practices. A listserv was launched, lis-editors@arl.org, and a web site for LIS Editors (http://lis-editors.org) was created for the group by the Association of Research Libraries. In addition, a small group of individuals volunteered to undertake the drafting of a statement based on an outline developed and approved during the group’s 2008 meetings.

Introduction

Library and information science journals serve a diverse readership of practicing professionals, researchers into LIS topics, faculty instructing future professionals and researchers, and students preparing for careers in library and information science. While readers seek a variety of information and have a wide range of interests and responsibilities, all expect that journals in the discipline adhere to high ethical standards and employ state-of-the-art editorial and publishing practices. In addition, authors submitting work for editorial and peer review similarly expect to be treated fairly, ethically, and consistently throughout the review and publishing process. They seek publications that will provide them with the best possible opportunity to reach their desired audience in the present and into the future.

While journal publishing generally follows norms that are broadly similar across fields, disciplines often develop unique characteristics or practices with regard to their journal

literature over time. These may reflect the particular balance of theoretical and applied research, predominant research methodologies, specific values that may be preferred within the discipline, or a host of other factors. In the case of LIS journals, too, some characteristics of the field have implications for the journal literature. Practitioner research is common and generally reflects a strong service orientation. By its nature, the LIS field is populated with individuals with a high awareness of state-of-the-art publishing practices and technologies and, in many cases, strong opinions about publishing policies. Consequently, LIS authors are perhaps more likely than those in many other fields to view less favorably journals that do not provide up-to-date publishing services or that work with retrograde policies. LIS editors, therefore, need to be cognizant of evolving best practices and diligent in ensuring that their journals are offering authors the highest quality publishing experience at all steps in the process.

While editors are the main audience for this document, authors, readers, and publishers will likewise benefit from a clear and public articulation of a consensus view of ethical behavior and also reasonable and contemporary publishing practices. However, the authors of this document hope that their work will also be useful to editorial board members, reviewers, and involved in scholarly communication.

This document has two parts. The first is a statement of ethics that describes reasonable expectations for the appropriate conduct of editors, the peer review process, and authors. The editorial committee believes that all LIS editors, and, where appropriate, authors should adhere to the ethical standards described here.

The best practices section describes what the editorial committee agrees are reasonable expectations for publishing practices that are of particular concern to the editorial function. The editorial committee recognizes that the state-of-the-art in publishing practices is an evolving benchmark in the digital environment, particularly for journals transitioning from print to electronic publishing. In light of this, the best practices expressed are considered achievable in the current publishing environment, although the committee recognizes that some journals may still be in the process of implementing some of these practices. Rather than expressing a lowest common denominator of practice or describing all current LIS practices, achievable best practices consonant with the values and practices of LIS professionals and researchers are provided.

When a journal fails to conform to ethical standards and best practices appropriate to the discipline, all facets of the editorial function are affected. The editorial function includes the recruitment, selection, and production of publishable articles. With regard to the recruitment function, an editor’s effectiveness is affected by the quality of the publishing services the journal supports. Attracting the highest quality work is an inherently competitive activity, and publishers cannot reasonably expect editors to perform it successfully if they are not able to offer authors what they regard as state-of-the-art publishing practices. Expeditiousness in turnaround on review, electronic availability to readers, wide dissemination, broad support for discovery, long-term access and
preservation, and reasonableness in rights transfer agreements are all important to authors. Publications that cannot meet best practices within the discipline present even the best editors with real handicaps as they attempt to fulfill their responsibilities to their journals.

A journal’s reputation for equitable review practices similarly affects recruitment. Any lack of well-defined and consistently applied review practices also compromises the selection function. Recruitment and selection are intellectually demanding and indispensible in maximizing the quality of a journal’s content. Author communication, negotiation of various issues during the review and publishing process, and the preparation and improvement of manuscripts are integral to the editorial process. Policies consistent with disciplinary norms can help make these activities minimally demanding of the editor’s time to allow the editor to focus as much energy and attention on the activities that are entirely dependent on the editor’s unique expertise.

By adopting the ethical standards described here and working toward conformity with the best practices identified, an LIS journal editor will be positioned to meet the general expectations of authors and readers within the discipline and related professions.

Ethics Statements for Editors, Authors, and Reviewers of LIS Journals

Ethics are principles of conduct or standards of behavior governing an individual or a profession. The integrity of our journals rests on the professionalism of its authors, reviewers (referees), and editors. The statements here describe ethical behavior for participants in the editorial processes of recruitment, selection, and production of publishable articles. Editors should conform to high standards of integrity generally and must also act ethically in their relationships with their publishers, reviewers and editorial board members, and authors. In addition, some principles are articulated for ethical behavior by authors in submitting their work to editorial processes and for ethical behavior by referees in the review process.

Section 1: Expectations of Editors in Executing Their Editorial Functions

The following statements of ethics apply to the conduct of LIS journal editors.

1A: Editor Integrity

- Editors are expected to adhere to the highest standards of journalistic practice and maintain honesty, integrity, accuracy, thoroughness, and fairness in all dealings with authors, editorial boards, and referees.
- Editors should make a clear distinction between editorials and other opinion pieces, articles, and advertising and ensure that these distinctions are communicated to authors and readers.
- Editors should honor existing commitments to publish papers, where there has been a change of editor.

1B: Relations with Authors

- Editors should hold authors to the highest standards of honesty, integrity, accuracy, thoroughness, and fairness in their writing and scholarship, i.e., research and its dissemination.
- Editors should ensure that authors have editorial and intellectual freedom.
- Editors should establish and maintain an expeditious process for constructive, prompt evaluation of submissions, whether accepted for publication or not.
- Editors should ensure that the integrity and confidentiality of the author’s work is maintained while that work is being evaluated for publication.
- Editors should work closely with potential authors in a transparent and timely manner.

- If the author's submission receives a peer review, editors should not reveal the identity of the referees to the author unless the referee grants permission. If a journal uses double-blind review, the editor, additionally, should not reveal the identity of the author to the referees.
- The editor should communicate the publication process succinctly and act to assist the potential author through the process, regardless of whether an article is solicited from a specific individual on an identified topic or if a manuscript is received unsolicited.

Commentary: Editors should understand that unpublished authors often have no idea as to what is expected of them. Indeed, many have no understanding of the publication process at all. At the same time, many will feel pressure to publish due to the promotion and tenure requirements of their institution. The editor should communicate instructions for authors, information about the peer review process (if applicable), deadlines and author obligations, and options for managing copyright and authors right to the potential author.

1C: Conflict of Interest

- Editors should avoid all conflicts of interest, as well as any appearances of such conflict.
- Editors should have no personal, financial, or other relationships that impinge on their responsibilities and ethical obligations as editor.
- An editor should not accept gifts or favors, except of nominal value, from any individual, companies, or associations in field/s that the editor's journal covers or from advertisers or potential advertisers.
- Editors should not give favorable editorial treatment to advertisers and potential advertisers because of their economic value to the publications; papers submitted by non-advertisers should receive unbiased editorial treatment.
- Editors should maintain an appropriate professional distance from the solicitation of advertising and the preparation of advertisements.

1D: Copyright and Author Rights

- Editors should be familiar with their publishers’ copyright policies, rights transfer agreements, and policies on author addenda to rights agreement. In addition, editors should be familiar with alternative rights management options for their authors if appropriate.
- Copyright and authors’ rights statements should be publicly posted.
- Editors should provide authors with information on the publisher's author rights agreement upon initial contact and have a responsibility to potential authors to respond with any questions or concerns with the journal’s copyright policies and rights transfer agreements.

- If an editor represents a publisher that does not provide such information publicly, the editor should work with the publisher to create a statement on copyright and author rights for provision to potential authors.

  Commentary: Many publishers have copyright and author rights statements on their websites, a practice editors should encourage. Editors can then easily direct potential authors to this information upon contact. It is desirable that such a statement includes a definition of terms, an explanation on the assignment of copyright, a description of publisher and author rights and responsibilities, and a statement of exclusions to policy requiring written permission from the publisher.

1E: Instructions for Authors

- Editors should ensure that "Instructions for Authors" statements are formulated and made publicly available, i.e., in the print journal, on a website, or both. Such statements should include:
  - Information on submission and reference style
  - Requirement for abstract content and length
  - Practices regarding provision of keywords for indexing
  - Required elements for author description
  - Handling of proofs and expectations regarding proof checking
  - Procedures for submission of and format requirements for artwork
  - Requirements for or limitations on handling mathematical or other non-Roman scripts
  - Capability of and requirements for producing color images and online materials
  - A description of the peer-review process, including any differences in the treatment of invited submissions and unsolicited manuscripts
  - Any ethic practices and standards of integrity expected of the author
  - If the publisher belongs to the Committee on Publication Ethics (COPE) and is represented by the editor, the Code of Conduct (http://publicationethics.org/code-conduct) should be provided to the author.

  Commentary: This information should be provided on the publisher's website for the journal. Where a publisher publishes multiple journals, instructions to authors should be easily accessible by title. The editor is responsible for providing this information to potential authors on request (even if it is not on the website) and should respond promptly to any questions or concerns.

1F: Peer Review

- Editors should inform authors of the journal's peer review practices including:
  - Use of open or blind review
  - Timelines for review

- Number of reviewers
- How decisions are made if all reviewers do not agree
- Role of the editor in peer review.

- Editors should ensure that those (e.g., referees, reviewers) conducting paper reviews have a clear understanding of their obligations and how comments will be shared with authors.
- Editors are ultimately responsible for ensuring that publication decisions match the aims, scope, and criteria of the journal.

Commentary: Peer review can occur by a variety of processes. A public description of the journal's peer review processes is ideal and a complete explanation of peer review is best communicated as part of the Instructions for Authors. Editors may provide paper reviewers with style guides, example reviews, templates for conducting reviews, and other tools to inform the preparation of a review.

1G: Commitments and Deadlines

- Editors should always respond immediately to the receipt of a manuscript, both solicited and unsolicited. The acknowledgment should address the peer review process, the number of reviewers, any page review processes expected of the author during layout, and the timeline involved. The editor should provide an exact timeline for informing the author of the reviewer(s) recommendations.
- If soliciting a manuscript, the editor should recommend a target deadline for submission of the initial draft although it may necessary to offer flexibility if the author cannot meet the assigned date.
- If changes are required for further consideration of the manuscript, this should be specifically stated with the required timeline for submission of the revision. The author should also be informed as to the review process for the revision, e.g., back to the same reviewer(s) or to the editor only.
- When the article is accepted, without or without revisions, the editor should notify the author immediately, provide an exact date for resubmission of the next iteration, and upon final acceptance, provide an estimated publication date and, if possible, indicate the journal volume and issue number. At a minimum, the editor should inform the author or authors the year in which the paper will be published.
- If, at the end of the peer review process, the decision is made not to publish, the editor should inform the author or authors immediately with an explanation for that decision.
- Editors should respond promptly to inquiries from supervisors and/or tenure/promotion committees concerning the peer review process, whether the work has been accepted for publication (is "in press"), and the importance of the published article to the profession.

Commentary: Often authors believe they cannot publish with a particular journal if the target submission deadline is not met, and, consequently, effective communication stops. The editor should inform the author that the topic is more important than an assigned timeline.
Section 2: Expectations of Authors in Their Participation in Editorial Processes

Like editors, authors are expected to adhere to the highest standards of practice in research and reporting of research, and in writing and submission of manuscripts.

2A: Authorship

- Any material submitted must be the author’s or authors' own work; it should be original and not published or submitted for publication elsewhere.
- To protect the integrity of authorship, only persons who have significantly contributed to the research or project and manuscript preparation should be listed as co-authors.
- All authors of articles submitted for publication assume full responsibility, within the limits of their professional competence, for the accuracy of their paper. Falsified research data are unacceptable.
- Authors should properly cite the work of others as well as their own related work. Plagiarism (the use or presentation of the ideas or words of another person from existing sources without appropriate acknowledgment of those sources) is unacceptable. Authors bear full responsibility for ensuring the accuracy and completeness of citations and bibliographic items.
- Authors are responsible for performing an appropriately comprehensive literature review in preparing their manuscript. They should not rely on editors or peer reviewers to fill in any gaps.
- Authors may list persons who made contributions to the work (but are not co-authors) in the Acknowledgment section along with their function or contribution.
- Authors should list sources of support (grants, etc.) in the Acknowledgment section.
- Authors are responsible for reviewing any editorial changes, including copy editing, to ensure that errors have not been introduced inadvertently. Typically some sort of final layout of an article is shared with the author or authors for this purpose.

Commentary: Authors are responsible for the quality and completeness of their work and should not assume that journals can provide comprehensive copy editing or citation checking. They can expect that editors will spot check citations for accuracy and completeness. Where copy editing is performed, it is often done by staff lacking detailed subject expertise and that it is possible for unintentional errors to be made. Thus it is crucial for authors to review all text, figures, tables, etc. to be sure that all remain accurate. Authors should not rely on editors and reviewers to rewrite articles, create abstracts, catch errors, or provide statistical analysis. Where an author has not fully mastered writing in English, editors may require authors to work with (and perhaps pay) an outside editorial advisor.

Authors should provide adequate supporting evidence for editors and reviewers to assess the accuracy of the findings and the appropriateness of the research methodology when they are presenting original research.

2B: Conflict of Interest

- Authors should not submit manuscripts with any commercial intent. Authors should reveal to the editor any potential conflict of interest that may influence the manuscript's content or be affected by the publication of the manuscript.
- Authors should disclose to the editor any commercial associations, contractual relations, proprietary considerations, or personal relationships that might pose a conflict of interest in connection with the manuscript.

2C: Redundant Publication

- Authors should avoid redundant publication (publication of a paper that overlaps substantially with one already published, is under editorial consideration elsewhere, has been published, or is in press).
- Authors should not submit to the same or different journals more than one paper describing essentially the same research or project.
- Authors should not submit the same manuscript for review to more than one journal at a time.
- Authors should describe at the time of submission whether there has been any prior presentation or dissemination of the same or very similar material. Prior dissemination does not automatically disqualify a paper, but the editor should make a fully informed decision regarding the novelty of the work.

Commentary: In the Web era it is not possible to provide a universal rule regarding what counts as previous publication. Journal editors differ in their expectations. However, authors should note at the time of submission whether the work is based on thesis or dissertation research, any earlier presentations of the work at meetings or previous distribution through electronic means, e.g., as a preprint. These do not usually disqualify a work for submission, but it is important for editors to be aware of the state of ongoing dissemination of the work. In addition, the cover letter should state that the work has not been submitted elsewhere. When in doubt, the author should consult with the editor and err on the side of disclosing potentially irrelevant information.
Section 3: Expectations of Referees in Executing Their Review Functions

Most scholarly journals use peer review to ensure the articles accepted for publication meet the journal's accepted standards for quality and to prevent the dissemination of unwarranted claims, irrelevant findings, unacceptable interpretations, and personal views. A peer review process may be open (in which the referees and the authors are identified to each other) or conducted in strictest confidentiality. This latter process may be a blind review in which either the author or referees are unknown to each other or double-blind review in which neither party is known to the other. The referee's responsibility is to provide advice on how to improve a manuscript and to help the editor to judge and justify the acceptance or rejection of the paper.

• The referee must be free of any conflicts of interest that might influence the content or the promptness of the review. When a referee is asked to review a paper and believes him- or herself to be placed in a position of possible conflict of interest, he or she should identify any potential conflicts to the editor so that the editor can determine if these are substantive enough to disqualify the referee.

• Referees should submit their reviews within the time frame specified by the editor.

• Referees should neither share the manuscripts they review nor the contents of referee correspondence without permission from the editor.

• Referees should strive to be fair in their review and to provide meaningful and useful commentary.

• Referees should focus comments on whether the manuscript makes a unique or valuable contribution to the literature, matches the scope of the journal, uses appropriate methodology, draws accurate conclusions, and is well-written.

• Referees should conduct reviews according to standards of professional courtesy. Constructive criticism is expected and should be provided with civility and professional respect.

Statements of Best Practices for Editors of LIS Journals

To fulfill the functions of recruitment, selection, and production of journal articles, editors of LIS journals can be most effective when journals provide up-to-date systems, processes, and policies to support the editorial process. The following series of statements identifies best practices for editors of LIS Journals. These statements describe effective practices that are in place for many journals and goals for which all journals should work toward achieving as soon as possible. Authors of manuscripts in the LIS discipline tend to be particularly well informed about publishing practices and to have high expectations of the publishing process. Where best practices are not in place, editors are at a competitive disadvantage in their efforts to obtain works of the highest possible quality.

1: Electronic Formats

- In today’s scholarly environment, electronic versions of journals are rapidly becoming the standard for access and preservation. Even if the journal only exists in print currently, publishers should move forward with plans to archive those print files in a standard format (e.g., .pdf) and move the publication entirely to an online setting.

Commentary: Publishing models today are in transition and continue to offer format options. Print is not necessarily “old school”; nevertheless, these best practices focus on electronic formats as the emerging model. Electronic versions add substantial value to readers in terms of facilitated discovery, access, usability, etc. If the print and online formats vary, the publisher and editor need to publicly post information about any differences between formats.

1A: Managing Electronic and Print Versions

- Editors and publishers should understand and communicate clearly the published content differences, if any, between print and online versions so that authors and subscribers understand format content differences. Authors need to know at the beginning of the publication process how their work will be disseminated and what the schedule will be.
- Where there are both print and electronic versions, policies about which format or e-version is the version of record should be clearly stated. In establishing such, the official version should be clearly designated in some way, e.g., in a publisher statement or notation, and always in a standard place.
- In considering electronic versions, either for primary access or archival value, the e-version should always include contributors, editors, titles, and other credits that enhance searchability for authors, reviewers, and opinion pieces. If content is rescripted for the online environment, the credits should accurately represent what readers find in the print version.

- The publisher should ensure that the links stay active or, if changed, that a notification process is in place so that all subscribers can adjust their records accordingly.

Commentary: See also the ongoing NISO work to develop a journal article version standard included in the section on Standards below.

1B: Release Schedule

- Regardless of release practice, publishers should have a stated policy for posting articles online and making them available to subscribers.

Commentary: Several options exist for release of e-formats, and publishers now use both. Early release means prior release of the entire issue or the individual article online before print distribution; prior release means as accepted before the final corrected proof of the article and production of entire issue. Simultaneous release (print and online) seemingly delays access and weakens the reason for e-access.

1C: Digitization of Back Files

- Digitization of any back issues is highly desirable to advance preservation and access. (See section on digital journal preservation.)

Commentary: Digitized back issues create critical mass and a single access point to attract online readership, enable value-added services, e.g., citation linking, etc. Many commercial and society publishers have already completed back file digitization, and services like JSTOR exist specifically to facilitate discovery, access, and use of backfiles of journal literature.

1D: Display of Editorial Information

- Each electronic issue should contain a standard description and standard placement of submission practices, as well as policies on issues such as copyright, permissions, etc. as they appear in any print format.

Commentary: Editors should consider policies as to author guidelines, indexes, and other standard features in context of article level, journal level, appearance in first or last issue of a volume, etc. Ideally, front and back matter pertaining to these specifics should appear in each print issue, so readers do not have to retrieve a different (usually first or last) issue for instructive information. A well-constructed website can accommodate these matters where print publications require additional pages per issue.

1E: Embargoes on Alternate Dissemination

- Embargoes (publisher-imposed blocks on access to content of electronic journals) are a reality of the marketplace, but the shorter the embargo period (ideally, no more than six months), the more readily information can be accessed

without unduly harming the publisher's revenue stream.

Commentary: Publishing practices vary with regards to embargo periods when content is hosted by an aggregator. Early projections proposed that online access would curtail subscriptions; thus, delaying full-text access through database providers, unless a local subscription exists, affects aggregators and researchers. Embargoes, as well as wholesale withdrawal of content from aggregators by publishers who establish their own platforms, remain a concern. With sophisticated search engines in place, researchers will seek information elsewhere rather than waiting for a time to pass before accessing a particular article.

1F: Metadata and Indexing

- Editors and publishers should have authors supply keywords for each article and incorporate these into the print and electronic versions.

Commentary: This is not a universal practice, but is a reasonable expectation of authors given the nature of the field. Metadata enhances discovery and elevates indexing amongst thousands of hits. Many authors of LIS works are expert in the creation of metadata, and LIS authors generally are very cognizant of the importance and value of extensive and high-quality metadata. Some online submission systems offer a controlled vocabulary to facilitate the assignment of metadata.

2: Authors Rights Practices

Background on Agreement Types
Publishers usually require an agreement with their authors in order to publish their article. Some types of agreements include:

1. Copyright Transfer Agreements where the author transfers copyright entirely over to the publisher, who often grants some rights (such as to disseminate in the author's classroom) back to the author.
2. Modifications of Agreements where an author transfers (permanently or temporarily) his copyright but the publisher allows for specific uses of the work desired by the author.
3. Author Addendum – Some authors choose to retain certain rights or make rights explicit with an Author Addendum. Others are required by a third party (grantor or employer) to include an author addendum with their copyright transfer agreement. Examples include:

   - The SPARC Author Addendum to Publication Agreement [http://www.arl.org/sparc/bm-doc/Access-Reuse_Addendum.pdf]
   - Science Commons Scholar's Copyright Addendum Engine [http://sciencecommons.org/]
   - MIT Amendment [http://info-libraries.mit.edu/scholarly/mit-copyri...-tool/]
   - Standard licenses by third parties, such as a Creative Commons license [http://creativecommons.org], which give authors the ability to keep the rights they want and allow others to know how the work can be reused.

Background on Copyright Options
With a few exceptions, authors have copyright until they sign it away. Publishers often need to license some rights to publish the work within the constraints of their business model.

Several possibilities exist for how authors can handle their intellectual property:

- Authors sign an exclusive rights transfer
- Authors can permit a nonexclusive rights transfer
- Authors can retain copyright and license some rights

Some authors must work under a third party’s conditions and therefore have constraints on what can be done with their work:

- Authors may need to honor a pre-existing license or agreement (for example, as a condition of their employment).
- Federal employees’ works are considered in the public domain.
- Some funders’ policies state that as a condition of receiving funding, the resulting work must be deposited in the funder’s repository.
- Some institutions have policies requiring work done at the institution must be deposited in the institution’s repository.

2A: Permissions

- Regardless of the type of agreement reached between the publisher and author, agreements should allow for authors to have the following permissions without payment:

  - Permissions for Sharing
    - Rights or permissions needed for author to post some version of the work on the author’s website
    - Rights or permissions needed for author to deposit some version of the work in public repositories
    - Rights needed to comply with funder requirements or institutional policies

  - Permissions for Teaching
    - Rights or permissions needed for author to use for course reserves
    - Rights or permissions needed for author to use for course packs

  - Permissions for Future Uses
    - Rights or permissions needed for author to use for derivative works
    - Rights or permissions needed for author to use for anthologies

2B: Editor Responsibilities

It is appropriate for editors to advocate on behalf of authors. Editors play an important role related to author rights with both publishers and authors.

Work with Publishers

• Editors should work to ensure the broadest access to their publication and the ability for authors to use their own works. With regard to copyright and usage rights, they should work closely with their journal’s publisher to ensure as much access as possible within the constraints of the publisher’s business model.

• Editors should advocate for more open agreements with their publishers.

• Editors should encourage their publishers to accept addenda where there are pre-existing arrangements or policies.

• Editors should advocate for exceptions when they believe it is in the best interest of the journal.

Work with Authors

• Editors often understand how publishers will react when an author puts forward changes to agreements, so editors should present authors with their agreement options and educate them on what it means to sign away copyrights.

• Editors should encourage or assist in self-archiving in an appropriate subject repository (e.g. E-LIS, http://eprints.rclis.org/) and the author’s institutional repository.

• Editors should encourage authors to consider how they want to use their works and what rights they want to retain to be able to do so.

3: Preservation

• Editors of library and information science journals should ensure that their publications, in both print and digital formats, are properly preserved.

Commentary: This is essential for the future use of journal literature, and it is also very important for setting a model for other professions. According to the American Library Association’s 2008 Preservation Policy, “the preservation of information content and information resources are central to libraries and librarianship.”

• Best practices and international standards for the proper preservation of the scholarly journal literature, particularly in digital form, are evolving. Editors should keep up-to-date on current preservation guidelines, and should monitor and actively influence their publisher’s and publication’s compliance with preservation best practices and guidelines.

• LIS editors should insist that their publications be produced to the highest level of usability, durability, and longevity in whatever medium is used, be it paper, film, magnetic tape, or optical disk.

3A: Print Journal Preservation

• In print format, journals should be produced and bound using paper and binding that meet the current standards of the American National Standards Institute (ANSI) and the International Standards Organization (ISO). ANSI NISO Standard Z39.48-1984 - Permanence of Paper for Publications and Documents in Libraries, adopted in 1984, is that current standard for paper quality. A compliance statement to this standard should be attached to the masthead or copyright area of the journal.

• At least two complete runs of a print journal -- that is, every print issue from volume 1, number 1, to the latest print issue – should be stored in a reliable print archive. Such an archive could be managed by a publisher, agency such as the Center for Research Libraries, or an individual library or library consortium that can demonstrate its commitment to long-term preservation of the print material under its care. A reliable print archive should comply with NISO’s environmental guidelines for the storage of paper records (NISO TR-01-1995) and commit to providing long-term storage and preservation of the journal’s print run.

3B: Digital Journal Preservation

• Increasingly journal literature is created and stored in digital formats. Digital preservation involves the conditions of the physical media, software used to organize and retrieve data in a meaningful way, persistent identifiers, stability (bitstream integrity), and data migration, when appropriate. It is essential that preservation metadata be provided for digital formats so that they can be read, processed, and actively managed for long-term use.

• For preservation purposes, digital content must be carefully prepared, stored, and maintained in a secure and actively managed information technology infrastructure. Editors should encourage their publishers to place copies of their digital journal content in the care of a trusted digital repository. An overview of the attributes and responsibilities of this type of trusted digital repository can be found in a 2002 RLG-OCLC report (http://www.oclc.org/programs/ourwork/past/trustedrep/repositories.pdf). A 2005 survey of e-journal archiving initiatives, such as Portico, LOCKSS Alliance/CLOCKSS, and OhioLink’s and the National Library of Australia’s e-journal archives (http://www.clir.org/pubs/reports/pub138/pub138.pdf), prepared by Anne Kenney et al. provides an overview of options for e-journal preservation storage.

3C: Record Retention for Editorial Working Papers and Correspondence

- Editors should ensure that their publishers and their journals have a record retention policy and program that will guide the enterprise on responsible and legal record retention.

Commentary: In the course of editorial work much documentation is accumulated, including various drafts of manuscripts, correspondence with authors and referees, referee and editorial staff reviews, and business correspondence. Best practice should guide the handling and retention of these materials.

- Record retention needs to be established and followed regardless of the format of material or business/editorial system used by the journal and its publisher. As more journals move online and employ editorial management software, it is incumbent on editors to insure these systems have adequate record retention capabilities.

- In general, a records retention program should include a retention schedule that identifies types of records to be retained, for how long, and under what conditions, as well as guidance on privacy and ownership of these records.

Commentary: For example, a journal and its publisher might identify types of records as follows: drafts of manuscripts, final manuscript, referee reviews, editorial reviews, author correspondence, editor correspondence, and business reports. Each type of record would have a retention schedule such as destroy immediately, retain for two years, retain permanently. Record could be stored locally or in a designated archive, and the records would be “closed” or “open” at a specified time.

4: Standards and Standards Organizations of Interest to Editors

Journals should conform to existing standards and implement new standards as quickly as is practicable.

Commentary: Conformity to relevant standards is important for any journal wishing to offer the optimum publishing service for authors and readers. The library community traditionally has been active and collaborative in standards development. Given that most standards applying to scholarly journals generally have been developed with the active participation of LIS professionals and are even a regular subject for journal articles, it is particularly important for LIS journals to conform to the most current standards.

No comprehensive listing of standards applying to journals is attempted here; however, some of the most broadly valuable recent standards and organizations creating or supporting standards are indicated here.

Organizations Engaged in Ongoing Standards Development

NISO, the National Information Standards Organization
http://www.niso.org

NISO produces and maintains a wide range of standards, many of which apply to
LIS journals. They develop information industry standards through the joint engagement of content publishers, libraries, and software developers. Please consult the organization’s web site for a full listing of current, superseded, and in-process standards. Current standards are available at http://www.niso.org/kst/reports/standards. A few of the recent standards and best practices that are of particular relevance to LIS journal publishing practices include:

- ANSI/NISO Z39.88 - The OpenURL Framework for Context-Sensitive Services
- ANSI/NISO Z39.9 - International Standard Serial Numbering (ISSN)
- NISO RP-7-2008 - Shared E-Resource Understanding (SERU)

EDItEUR, The International Group for Electronic Commerce in the Book and Serials Sectors
http://www.editeur.org/

EDItEUR is the international group coordinating development of the standards infrastructure for electronic commerce in the book and serials industries.

ONIX for Serials Suite (In partnership with NISO)
ONIX for Serials is a family of XML formats for communicating information about serial products and subscription information, using the design principles and many of the elements defined in ONIX for Books.

UK Serials Group
http://www.uksg.org

Spanning the wide range of interests and activities between serials producers and readers, members of the UK Serials Group comprise more than 500 organizations, many of them based outside the UK, that engage a broad cross-section of people concerned with the publication, distribution and use of serials.

TRANSFER Code of Practice
http://www.uksg.org/transfer
The TRANSFER Code of Practice responds to the expressed needs of the scholarly journal community for consistent guidelines to help publishers ensure that journal content remains easily accessible by librarians and readers when there is a transfer between parties, and to ensure that the transfer process occurs with minimum disruption.

Key standards-related initiatives arising in recent years

Project Counter
http://www.projectcounter.org/

The COUNTER Codes of Practice comprise sets of agreed international standards and protocols governing the recording and exchange of online usage data.

Crossref and DOI:
http://www.crossref.org/

CrossRef is an independent membership association, founded and directed by publishers. It is the official DOI® link registration agency for scholarly and professional publications and operates a cross-publisher citation linking system that allows a researcher to click on a reference citation on one publisher’s platform and link directly to the cited content on another publisher’s platform, subject to the target publisher’s access control practices.

Open Archives Initiative:
http://www.openarchives.org/
With roots in the open access and institutional repository movements, the Open Archives Initiative develops and promotes interoperability standards that aim to facilitate the efficient dissemination of content. It has developed protocols for metadata harvesting and object reuse and exchange.

ALCTS: Association for Library Collections & Technical Services
A division of the American Library Association, ALCTS engages a wide range of members working with journals. The association maintains a list of serial standards and related initiatives at:
http://www.ala.org/ala/mgrps/divs/alcts/resources/guides/serstdsbib/index.cfm

ALPSP: Association of Learned and Professional Society Publishers
An international trade association for not-for-profit publishers and those who work with them, ALPSP maintains information on standards at:

NASIG: North American Serials Interest Group
http://www.nasig.org
NASIG is an independent organization that promotes communication, information, and continuing education about serials and the broader issues of scholarly communication. NASIG Guides occasionally address key serials standards and related initiatives. See http://www.nasig.org/publications_guides.cfm
